ABSTRACT

The cord securing device has a housing device in operative engagement with a sliding device. The housing has an opening (6B) defined therein and the sliding device has an opening (6C) defined therein. A cord portion (4A) of the cord extends through both the opening (6B) and the opening (6C) and along an upper surface (500) of the housing. The sliding device has a first securing edge 9 and a second securing edge 14 at the opening (6C). The edges 9, 14 bear against the cord to hold the cord to the sliding device as a pulling force F2 urges the sliding device in a first direction and a pulling force S1 urges the cord portion (4A) in a second direction. The cord urges a lower sliding surface 1C of the housing against an upper sliding surface 2C of the sliding device while permitting the sliding device to slide within the housing.
